"The Highway Safety Manual (HSM) is a resource that provides safety knowledge and tools in a useful form to facilitate improved decision making based on safety performance. The focus of the HSM is to provide quantitative information for decision making. The HSM assembles currently available information and methodologies on measuring, estimating and evaluating roadways in terms of crash frequency (number of crashes per year) and crash severity (level of injuries due to crashes). The HSM presents tools and methodologies for consideration of 'safety' across the range of highway activities: planning, programming, project development, construction, operations, and maintenance. The purpose of this is to convey present knowledge regarding highway safety information for use by a broad array of transportation professionals"--P. xxiii.

Become an Expert on the Work Breakdown Structure! The basic concept and use of the work breakdown structure (WBS) are fundamental in project management. In Work Breakdown Structures for Projects, Programs, and Enterprises, author Gregory T. Haugan, originator of the widely accepted 100 percent rule, offers an expanded understanding of the WBS concept, illustrating its principles and applications for planning programs as well as its use as an organizing framework at the enterprise level. Through specific examples, this book will help you understand how the WBS aids in the planning and management of all functional areas of project management. With this valuable resource you will be able to: • Tailor WBSs to your organization's unique requirements using provided checklists and principles • Develop and use several types of WBS • Use WBS software to gain a competitive edge • Apply the 100 percent rule when developing a WBS for a project or program • Establish a WBS for a major construction project using included templates • Understand portfolio management and establish an enterprise-standard WBS

Experts address some of the main issues and uncertainties associated with the design and deployment of Automated Highway Systems (AHS). They discuss new AHS concepts, technology, and benefits, as well as institutional, environmental, and social issues - concerns that will affect dramatically the operation of the current highway system from both the vehicle and infrastructure points of view.

The technical report developed as part of this project presents issues and concerns and shows potential values generated for design speeds of 85 to 100 mph (140 to 160 km/h) for: stopping sight distance, grades, vertical alignment, lane width, shoulder width, cross slope, horizontal alignment and superelevation, ramp design speed, ramp grades and profiles, ramp cross section and cross slope, distance between successive ramps, ramp lane and shoulder widths, ramp acceleration and deceleration lengths, roadside clear zones, median width, roadside slopes and ditches, crash testing, and roadside safety devices.
