An interest point (key point, salient point) detector is an algorithm that chooses points from an image based on some criterion. Typically, an interest point is a local maximum of

some function, such as a "cornerness" metric. A descriptor is a vector of values, which somehow describes the image patch around an interest point.

Descriptors have been proposed in the literature with a variety of definitions for what kind of points in an image is potentially interesting (i.e., a distinctive attribute). This chapter introduces basic notation and mathematical concepts for detecting and describing image features.

Feature detection is a low-level image processing operation. That is, it is usually performed as the first operation on an image, and examines every pixel to see if there is a feature

present at that pixel. If this is part of a larger algorithm, then the algorithm will typically only examine the image in the region of the features.
