Chemically modified oligonucleotides (ONs) are routinely used in the laboratory to assess gene function, and clinical advances are rapidly progressing as continual efforts are being made to optimize ON efficacy. Over the years, RNA interference (RNAi) has become one of the main tools used to inhibit RNA expression across a wide variety of species.

CRISPR or Clustered Regularly Interspaced Short Palindromic Repeats is a naturally occurring prokaryotic immune defense mechanism that has been recently used for eukaryotic gene editing and modification. RNAi or RNA interference is a sequence-specific method to silence genes by introducing small double-stranded RNA which mediates with nucleic acids and regulate gene expression. This can be taken as the basic difference between CRISPR and RNAi.

RNA interference (RNAi) is a method of blocking gene function by inserting short sequences of ribonucleic acid (RNA) that match part of the target gene's sequence, thus no proteins are produced.

Although fungi lack adenosine deaminase acting on RNA (ADAR) enzymes, adenosine to inosine (A-to-I) RNA editing was reported recently in *Fusarium graminearum* during sexual reproduction. In this study, we profiled the A-to-I editing landscape and characterized its functional and adaptive properties in the model filamentous fungus *Neurospora crassa*. A total of 40,677 A-to-I editing sites were ...

Since RNA editing has an impact on various biological processes, there have been studies showing that aberrant activities of deaminase proteins can lead to various human diseases such as cancer and neurological disorders. In fact, higher levels of RNA editing and high expression of these proteins are often found in cancer. Therefore, modulating RNA editing mediated by these proteins can be a promising therapeutic strategy for cancer treatment. References

Genome editing, or genome engineering, or gene editing, is a type of genetic engineering in which DNA is inserted, deleted, modified or replaced in the genome of a living organism. Unlike early genetic engineering techniques that randomly inserts genetic material into a host genome, genome editing targets the insertions to site specific locations.

RNA interference (RNAi) is a biological process in which RNA molecules inhibit gene expression or translation, by neutralizing targeted mRNA molecules. Historically, RNAi was known by other names, including co-suppression, post-transcriptional gene silencing (PTGS), and quelling. The detailed study of each of these seemingly different processes elucidated that the identity of these phenomena ...
